

Semester Project

Modelling and simulation of an electric vehicle (with Matlab or Python)

- Select a commercially available electric vehicle.
- Derive and plot the speed and acceleration characteristic curve
- Choose and implement an appropriate driving profile
- Calculate possible range of the vehicle with a full battery for the corresponding driving profile
- Make logical assumptions for missing constants/parameters (should be marked in red)
- Submit a small report (12 to max. 20 pages) & and present your results (approx. 20 minutes)

Deadline: At the latest one week before September 15th.
